The nature of the driving forces and the mechanism of functioning of bio-objects from the point of view of physics and physical chemistry is shown. Bio-objects in their livelihoods are a totality of chemical reactions and energy flows generated by the difference in potentials, non-equilibrium of the system. The movement of the intracellular assembly conveyor is provided by energy flows that deliver the substance to the place of chemical reactions and remove the reaction products. The entire set of streams and chemical reactions and their sequence are regulated, as part of the ratio of stability, self-regulation of enzymatic reactions.
